Camera Moves Add-Ons

Short camera lines you add to the end of any AI video prompt - so the camera pushes in, pulls back, circles or rises exactly the way a real film camera would, instead of staying flat and still.

Free student notes - Pictures, Images & Video set

What this note is: a single shortcut, on its own, so you can save it, print it and use it in seconds. Write your normal video prompt, then paste one or two camera lines from page 2 at the end. Works in Google Flow, and in other AI video tools that take written prompts.

The copy-and-paste camera add-ons

Keep your scene prompt as it is. Add **one main move** and, if you want, **one shot size** from the lists below. That is the whole shortcut.

Main moves - pick one

Movement lines

Works in: Google Flow - AI video tools

> Slow push-in: the camera moves closer to the subject, building focus and emotion.
> Slow pull-back: the camera moves away, revealing the full scene around the subject.
> Smooth pan left to right: the camera turns sideways, following the scene across.
> Gentle tilt up: the camera rises from the ground to the top of the subject.
> Slow orbit: the camera circles halfway around the subject, keeping it in the centre.
> Tracking shot: the camera moves alongside the subject as it walks or runs.
> Aerial rise: the camera lifts high above the scene like a drone taking off.
> Handheld feel: slight natural shake, like a real person filming on a phone.

Rule: one main move per clip. Two opposite moves in one prompt - push-in and pull-back together - confuse the tool and spoil the shot.

Shot size - add one if needed

Add this line	What you get
Extreme close-up on the face	Emotion first - eyes, expression, a tear or a smile.
Medium shot, waist up	The natural choice for talking, teaching and presenting.
Wide shot of the whole scene	Place first - a classroom, a bazaar, a mountain valley.
Over-the-shoulder shot	We see what the character sees - good for reading, writing and screens.

> **Add speed and mood in three words:** end the line with "slow and smooth" for calm scenes, "fast and energetic" for sports and action, or "steady and cinematic" for a film look. Speed words change the feeling of the same move completely.

One scene, three different films

The scene never changes - only the camera lines at the end change. Base prompt: "A young student opens a science book on a desk near a window, morning light, smiling as she finds the right page."

Camera lines added	Feeling of the clip
Slow push-in, extreme close-up on the face, slow and smooth.	Personal and emotional - we share her moment of understanding.
Wide shot of the whole scene, gentle tilt up, steady and cinematic.	Calm and grand - the room, the light and the morning matter most.
Over-the-shoulder shot, tracking slightly as she turns the page.	We learn with her - the book and her hands lead the story.

Ready-made combinations to copy

- **Lesson video opening:** "Aerial rise over the school, then slow push-in to the classroom window, steady and cinematic."
- **Story character moment:** "Medium shot, waist up, slow orbit halfway around the character, soft evening light."
- **Science experiment:** "Over-the-shoulder shot, slow push-in to the experiment on the table, clear and steady."
- **Nature scene:** "Wide shot of the whole valley, smooth pan left to right, slow and smooth."
- **Phone-style real moment:** "Handheld feel, medium shot, natural movement, like a real person filming."

Keep the subject still in words. If your prompt also asks the subject to run, turn and wave while the camera orbits and rises, the tool cannot do everything at once and the clip turns messy. Simple subject action plus one camera move gives the cleanest result.

Short clips, one move. Most AI video clips are only a few seconds long. Ask for the second move as a second clip, then join the clips - that is how real films are made too.
