Science Diagram

One copy-and-paste prompt that turns any science topic into a clean, labelled diagram - parts of a plant, the human heart, the water cycle and more - ready to study from and copy into your notebook.

Free student notes - November 2026

For: School, college and university students who need a clear diagram for study, revision, a chart or a practical notebook. **Works with:** ChatGPT, Gemini, Claude, Google AI Studio and other AI tools that can make images. **Time:** 3 minutes to generate, 5 minutes to check every label.

A good diagram teaches faster than a paragraph

Science is full of things you cannot learn from words alone: the chambers inside a heart, the layers inside the Earth, the journey of water from sea to cloud to rain. A paragraph describes them one line at a time. A labelled diagram shows the parts, their order and their direction in a single look - and that picture stays in memory far longer.

This shortcut gives you that picture on demand. Instead of searching for a diagram and finding a blurry or wrong one, you describe exactly what you need: the topic, the parts, the exact label words, and a clean textbook style. The AI draws it, and you check it against your book.

> **Remember:** The diagram is a study draft, not the final truth. AI image tools are strong at drawing and weak at spelling. Your job is always the same: check every label and every part against your textbook before you copy or submit anything.

What this prompt makes AI do

- **Draw one topic only** - one clear diagram per image, never a crowded poster of five topics.
- **Label every part** - with the exact words you list, joined by thin leader lines.
- **Keep it textbook-clean** - white background, flat colours, no decoration, no shading tricks.
- **Show direction** - arrows where something flows, moves or changes, like blood or water.
- **Leave space** - labels outside the drawing, so nothing overlaps and everything can be read.

Diagrams this works best for

Type	Examples
Parts of a thing	Parts of a plant, parts of a flower, the human eye, a microscope
Cycles and processes	Water cycle, life cycle of a butterfly, photosynthesis, food chain
Inside views	Human heart, layers of the Earth, inside a leaf, an atom
Systems	Solar system, digestive system, simple electric circuit

The copy-and-paste prompt

Copy the box below exactly. Replace **[TOPIC]** with your diagram and **[LABELS]** with the exact label words from your textbook chapter, then paste it into an AI tool that can make images.

The Master Prompt

ChatGPT - Gemini - Claude - AI Studio

> Create a clean, labelled science diagram of [TOPIC] for a school textbook. White background, flat colours, clear black outlines, simple and uncluttered. Label ONLY these parts, spelled exactly as written: [LABELS]. Put each label outside the drawing with a thin straight line pointing to its part. Use arrows to show any flow or movement. No extra parts, no extra words, no title inside the image, no decoration, no watermark. Style: simple educational diagram a student can copy by hand.

Tip: The label list is the secret. Copy the words from your book chapter, in order, separated by commas. If a part is not in your list, a good diagram should not invent it - and if the AI adds one anyway, that is your signal to regenerate.

Three useful variations

1. No Labels - Test Yourself

> Create the same clean science diagram of [TOPIC] on a white background, but with NO labels and NO words at all. Keep thin blank leader lines pointing to each main part, so I can write the labels myself as a test.

Use when: Revising for an exam. Print it or copy it, fill in the labels from memory, then check with the book.

2. Cycle or Process Diagram

> Create a circular cycle diagram of [TOPIC] on a white background. Show these stages in order, connected by clear arrows going clockwise: [STAGES]. Label each stage with its exact name. Flat colours, simple icons, no extra words and no decoration.

Use when: The topic goes round in a loop - water cycle, carbon cycle, life cycles, or the rock cycle.

3. Cross-Section - Inside View

> Create a cross-section diagram of [TOPIC], as if it is cut open so the inside layers and parts can be seen. White background, flat colours, each layer in a different soft colour. Label ONLY these parts, spelled exactly: [LABELS]. Labels outside the drawing with thin lines. No extra parts or words.

Use when: The learning is inside the thing - layers of the Earth, inside a seed, skin layers, or the heart.

See the difference - The Water Cycle

A weak prompt

> Make a water cycle diagram.

You will get a pretty picture - but often with arrows the wrong way, stages missing, and labels spelled like "Evapration". Pretty is not the same as correct.

A strong prompt

> Create a circular cycle diagram of the water cycle on a white background. Show these stages in order, connected by clear arrows going clockwise: Evaporation, Condensation, Precipitation, Collection. Draw the sun, a cloud, rain falling on hills, and water collecting in a sea. Label each stage with its exact name, spelled exactly as written here. Flat colours, simple educational style, no extra words.

Now the AI knows the four stages, their order and their spelling. Checking takes one minute: four labels, four arrows, all the right way.

Check every label - the 1-minute checklist

1. **Spelling:** Read each label letter by letter against the book.
2. **Parts:** Is every listed part present - with no extra part added?
3. **Lines and arrows:** Does each line touch the correct part, and each arrow point the true way?

> **If one check fails:** Reply with one clear correction - "Correct spelling: Evaporation. Regenerate with only that change." Then check again.

Use AI honestly

Draw it yourself for submission. If your teacher asks for a hand-drawn diagram, use the AI version as a guide and draw your own.

Check important facts. AI can draw a confident, wrong diagram. Your textbook and teacher are the final authority. Never upload personal photos or documents - a topic name and label list are enough.

Try it now - 3 quick tasks

1. Run the Master Prompt on one diagram from your current chapter, with its exact label list.
2. Run the 1-minute checklist, and regenerate if any label is wrong.
3. Try the No Labels version and fill in the labels from memory.
