Science Experiment Video

One copy-and-paste prompt that turns any science experiment into a short, clear video - step by step, in simple words, so the whole class can see what happens and why.

Notes by Shah Fahad

Free student notes - Video set

What this note is: a single shortcut, on its own, so you can save it, print it and use it in seconds. It has two parts: a helper prompt for a chat AI that writes your video prompt for you, and the video prompt itself to paste into Google Flow or any other video AI tool.

Step 1 - Let a chat AI write your video prompt

The helper prompt

Works in: ChatGPT - Claude - Gemini - Muse

> Write a text-to-video prompt for a science experiment video. The experiment is: [EXPERIMENT NAME]. My class level is [CLASS]. Follow these rules:
> 1. Break the experiment into 4 short scenes: the materials, step 1, step 2, and the final result.
> 2. For each scene, write ONE clear video prompt with: the objects, the action, the place, the camera view (close-up or wide), and bright, clean lighting.
> 3. Keep every scene safe and realistic - only show steps that are safe to do in a school classroom.
> 4. Use simple words a [CLASS] student understands.
> 5. End each scene prompt with: "realistic, clear, no text, no watermark".
> Give me the 4 scene prompts, numbered, ready to copy one by one.

Fill the brackets: replace [EXPERIMENT NAME] with your experiment, for example "baking soda volcano" or "how a plant drinks water", and [CLASS] with your class, for example "Class 6".

Step 2 - Paste one scene at a time into the video tool

The video prompt

Works in: Google Flow - and other video AI tools

> A clear science experiment on a clean school lab table: [DESCRIBE THE ONE STEP - for example: a hand slowly pours vinegar into a small clay volcano]. Bright daylight, close-up camera, slow and steady movement, realistic colours, every object sharp and easy to see, realistic, clear, no text, no watermark.

One step per clip: video tools make short clips, usually only a few seconds. Generate one clip for each step, then join the clips in any free video editor and add your own voice or captions explaining each step.

> **Why plan the scenes first:** if you type only the experiment name, the video tool guesses - and it often guesses wrong steps in the wrong order. Four planned scenes give you a video that teaches, not just a video that moves.

Worked example - the baking soda volcano

Experiment: baking soda volcano, Class 6 - four scenes like these:

Scene	Video prompt to paste
1. Materials	A small clay volcano, vinegar, baking soda and red food colour on a clean lab table, wide view, bright daylight, realistic, clear, no text, no watermark.
2. Step 1	Close-up: a spoon adds baking soda powder into the top of the clay volcano, slow steady movement, bright daylight, realistic, clear, no text, no watermark.
3. Step 2	Close-up: a hand slowly pours vinegar with red food colour into the top of the volcano, slow steady movement, bright daylight, realistic, clear, no text, no watermark.
4. Result	Red foamy bubbles erupt gently from the volcano and flow down its sides like lava, wide view, bright daylight, realistic, clear, no text, no watermark.

Join the four clips in order and record one sentence per scene - that voiceover turns clips into a lesson.

Make it fit your class

Add one of these short lines to the helper prompt to change the video:

Add this line	What changes
Make it for very young students - big objects, very slow steps.	Simpler scenes primary children can follow easily.
Add a 5th scene that explains WHY the result happens.	The video ends with the science idea, not just the show.
Write the captions in Urdu, science words in English.	Captions your class can read while watching.
Use only materials easily available in a school or home.	No scene asks for anything hard to find or expensive.

Safety first - always. Only make videos of experiments that are safe in a classroom. Never try an experiment with fire, strong chemicals, or electricity from a wall socket, or anything your teacher has not approved. If you are not sure, ask your teacher first.

An AI video is not proof. Video tools can show a result that looks real but is scientifically wrong - colours, speeds and reactions can all be invented. Trust your textbook and your real classroom experiment for the facts.
