AI NOTES SERIES - PROMPT SHORTCUTS

Study Timetable Planner

One copy-and-paste AI prompt that builds a realistic study timetable around your school hours, homework and free time - daily, weekly, or counting down to an exam. For ChatGPT, Claude, Gemini, Muse and other AI tools.

How to use this note: Copy the master prompt on page 3, fill in your subjects, school hours and exam date, and paste it into any AI app. Then adjust the plan with the follow-up prompts on page 4.

A timetable that fits real life

Most timetables fail because they are built for a perfect day that never happens. A plan that fits real life starts from your fixed times and protects your rest.

Build around fixed times first

- **Fixed:** school hours, travel, meals, prayer, family time and sleep - these do not move.
- **Flexible:** homework, revision and reading - these fill the gaps that are left.
- **Free:** play, friends and rest - a timetable with no free time will be abandoned in a week.

Use short, focused blocks

- Study in blocks of 25 to 40 minutes, then take a 5 to 10 minute break.
- Put the hardest subject first, when your mind is freshest.
- Give weak subjects more blocks, but never drop a subject completely.
- End the day with 10 minutes of light revision - it helps memory while you sleep.

> **Golden rule:** Two honest hours followed every day beat six planned hours that never happen. Make the plan smaller until you can actually do it.

The master prompt - copy, fill, paste

Replace the parts in brackets, then paste the whole prompt into ChatGPT, Claude, Gemini or Muse.

MASTER Study Timetable Planner

Best for: a full weekly plan

> "Act as my study coach. Build me a realistic weekly study timetable. My class is [e.g. Class 8]. My subjects are [list them]. School is from [start time] to [end time]. I can study [number] hours on school days and [number] hours on weekends. My weakest subjects are [name them]. My exam starts on [date, if known]. Rules: put my weakest subject first in the day, use study blocks of 30 minutes with 10-minute breaks, include homework time, free time and one light day, and present the plan as a clear day-by-day table. After the table, give me 3 tips to follow it."

Tip: Be honest about your hours. If you write 5 hours but really have 2, the AI will build a plan you cannot follow.

Before you press send, check

1. Did you list **all** your subjects, not only your favourites?
2. Did you give your real school and sleep times?
3. Did you name your weakest subject honestly?

Five variants for five jobs

Same idea, different job. Pick the variant that matches what you need today.

1 Exam Countdown Plan

Best for: last 2-4 weeks

> "My exam starts on [date]. I have these subjects and chapters left: [list]. Build me a day-by-day countdown plan until the exam. Put unfinished chapters first, add one full revision day for each subject, and keep the last 2 days light for final revision and rest. Show it as a table with dates."

Tip: Count backwards from the exam date - never plan forwards and hope you finish.

2 Daily Homework Routine

Best for: school days

> "Make me a simple after-school routine for a school day. School ends at [time]. I have homework in [subjects], dinner at [time], and I sleep at [time]. Give me a short routine with homework first, then 30 minutes of revision, then free time. Keep it under [number] hours in total."

Tip: A routine you repeat daily needs no willpower - the clock decides, not your mood.

3 Weak-Subject Rescue Plan

Best for: one struggling subject

> "I am weak in [subject], especially [topic]. Make me a 2-week rescue plan: 30 minutes a day on this subject only, starting from the easiest basics and moving step by step to harder questions. List what to study each day and add a small test for Day 7 and Day 14."

Tip: Start from the basics you missed - a weak topic is usually a missing earlier step.

4 Weekend Revision Plan

Best for: Saturday-Sunday

> "Plan my weekend revision. On Saturday and Sunday I can study [number] hours each day. I need to revise [subjects / chapters]. Split the time into morning and evening blocks, revise a different subject in each block, and leave Sunday evening completely free."

Tip: Revise in the morning when possible - weekend evenings rarely survive family plans.

5 Primary-Class Timetable

Best for: Classes 1-5 / parents and teachers

> "Make a gentle study timetable for a primary school child in Class [1-5]. School is [times]. Keep study blocks to 15-20 minutes, mix reading, writing and maths, include play time and story time, and make a simple table a parent can follow at home."

Tip: For young children, short and regular beats long and rare - and always end with something fun.

Worked example - a Class 8 week

The master prompt, filled in for a Class 8 student weak in Mathematics, can produce a week like this:

Day	Block 1 (fresh mind)	Block 2	Evening light revision
Mon-Fri	Mathematics (30 min)	Homework + Science or English (30 min)	10 min: re-read today's class notes
Saturday	Urdu + Islamiyat revision	Weak-topic practice: Maths	Free
Sunday	Light day: reading only	Prepare bag and books for Monday	Free

Notice: the weak subject comes first, blocks stay short, Sunday stays light, and free time is written into the plan - not left to chance.

Stick to it - and fix it honestly

The weekly review (10 minutes, every Sunday)

1. Tick the blocks you actually finished - be honest, not kind.
2. Move missed blocks once; if a block is missed twice, it is too big or at the wrong time - change it.
3. Ask the AI to adjust: *"Here is what I actually did this week: [paste]. Adjust next week's timetable to be more realistic."*

Three rules that protect the plan

- **Phone away:** keep the phone in another room during study blocks.
- **Sleep first:** never cut sleep to add study - a tired brain forgets.
- **Missed day is not a failed week:** restart the next day, do not double up in panic.

Use AI honestly.

A timetable is a tool for organising **your** study. The learning still has to happen in your own mind, in your own time. Plans copied from a friend rarely fit - and marks earned by cheating help no one.

Next step: Build your plan with the master prompt, print it, and stick it where you study. Review it on Sunday, adjust it once a week, and let it grow with you.
